# Solar Energy

Solar power captures radiant light and heat from the sun and converts it into clean energy that can be used to power homes, businesses and machinery. This renewable energy source, first used commercially more than 100 years ago, is growing rapidly as people look for sources of energy that are sustainable and environmentally sound both in industrial nations like the United States and third world countries that need to power growth.

In fact, solar power is expected to become the world's biggest source of electricity by 2050, according to the International Energy Agency. Take a drive through Southern California or other areas that get a lot of sunshine and you will see how popular solar power is. On any major road, you will undoubtedly see houses, parking structures, schools, highway signs, and stores that have added solar panels to harness solar energy for electrical appliances, air conditioning, lighting, water heaters and other purposes. And more solar panels go up daily as people realize the cost-efficiency and clean nature of solar energy.
